

GIS' Vendor Credential Management was built to assist organizations with onboarding and managing the multitude of vendors required to keep their business running smoothly. Our platform provides the sponsoring company with a secure web-based solution to onboard vendor companies and independent contractors, combined with the configurable workflows and reporting options that are needed to effectively manage even the most complicated vendor networks.

A faster, better, smarter way to manage the risk associated with vendor relationship credentials.

- Invite vendor businesses to complete an online vendor application and check their business credentials, owner credentials, and employees' credentials in the process.
- Run consumer background checks to ensure that the business primaries are eligible to work with the sponsor company and to ensure that business and individual licenses and certifications are valid and current.
- Keep up-to-date on whether vendors have completed their application and onboarding forms in a timely fashion, and ensure that they provide any new information or documentation as old information expires.
- Utilize a dynamic reporting dashboard for real-time reports on a variety of metrics which helps to simplify the management of even the most extensive vendor networks.
- Take advantage of user hierarchies which allow certain employees to manage the entire program and other employees to only see what they need to see.
- Provide the vendors with insight into their application process, cutting down on status update requests to sponsor company employees.
- Allow for the sponsor company to pay for the credentialing, or for the vendor companies to do so depending on sponsor company needs.
